vSEC:CMS® Identity

Introducing vSEC:CMS Identity

The new authentication server integrates directly into existing vSEC:CMS deployments. During the initial credential issuance process, administrators can generate a device-bound FIDO2 passkey for immediate user authentication with vSEC:CMS Identity.

yubico

Yubico Security Key Enterprise Edition

This update introduces full lifecycle management for the Yubico Security Key Enterprise Edition via YubiKey as a Service (YaaS).

Hybrid Environment Passkeys Management

Organizations can now use their primary Active Directory account as the identity foundation to issue both PKI certificates and FIDO2 passkeys, while connecting directly to Azure Entra ID. This eliminates duplicate accounts and insecure workarounds.

Short-lived Temporary Domain Passwords

To maintain business continuity when a hardware token is misplaced, administrators can configure short-lived temporary passwords for Domain accounts in a controlled and auditable way when hardware token replacement is not possible.
