

## Product Release

# A New Chapter - vSEC:CMS Version 7.0

### SERVER

**Multiple Passkeys Enrollment** allows, during Issuance, the enrollment of one authenticator in more than two different IdPs and generates multiple passkeys simultaneously.

**Alerts to Webhook** allow you to push system health events with HTTPS to add alerts to SIEM infrastructure, or similar.

**Configuration Audit Trail** collects system configuration changes, including username and time of changes. It provides accountability and tracks changes, increasing security and visibility.

**Add New HSM By Migrating Admin Keys of the Credential** allows you to switch to a new HSM with a new master key. Eliminates the need to migrate Master Keys between HSMs.

**Entra ID User Information Extended** allows you to utilize user information in Microsoft Entra ID for other integrations. Suitable for hybrid and cloud environments.

**Passkey Dynamic Display Name** allows you to edit the passkey display name for the user in the IdP. Lets you add a dynamic value instead of a fixed name for all users. It can be generated based on user-specific values.

### ADMIN

**Credential Template Description** found on the Issuance Screen (Agent and Admin apps) assists you in choosing the right template for management.

**One Step Unregistration** allows you to return a token or smartcard from every lifecycle stage to the factory default state. Automatically takes the identity device through revocation and clean up in 1 click.

**Joakim  
Theorén,  
CEO**

“As the seventh major version of our credential management system, vSEC:CMS, it represents a significant achievement in its development, and at the same time, we’re eager to continue building on our success. We are excited about all 7.0 feature sets will bring to our customers: performance tuning, updated architecture, new interfaces, and powerful automation features.”

#### Download the latest - vSEC:CMS Version 7.0!

New and existing customers are now able to download the newest version, and enjoy the new features:

## Product Release

# A New Chapter - vSEC:CMS Version 7.0

### ADMIN

System Health Information Panel lets you quickly see system health notifications on the Admin Home Screen and resolve them promptly. For urgent alerts, choose to be notified by email.

PKI and FIDO Device PIN Selection allows you to request employees to set the PINs only for the technology to be used in combined devices (PKI + FIDO).

### SECURITY DEVICE

Four Plus PIV Certificate Support allows you to manage more than four PIV certificates, which is the PIV standard, on a PIV smart card or token. Functionality is limited to the PIV devices that offer a supporting MiniDriver.

Token2 PIN+ FIDO2 Security Keys Series can now be managed using our new HID interface integration. Allowing administration over USB as an alternative to the already available NFC interface integration.

vSEC:CMS Version 7.0 represents the launch of a mature FIDO credential management system.
